Technical Test

New payroll system for a fictional company

Last Updated October 2025

This short programming exercise is designed to gauge your knowledge and approach to problem-solving.

There are many valid ways to complete the test; there’s no single ‘right’ answer.

Thank you for taking the time to complete it. If you have any questions or need clarification, don’t hesitate to contact us.

/ Technical Test

Our fictional company requires a new payroll system.

Your task is to write the functionality that determines the dates employee's salaries are to be paid.

Payday is the second-to-last day of the month. If this date falls on a weekend, then payday is the Friday before the weekend.

It takes four working days for the employee to receive their salary after payment has been sent.

Your task

Create an API endpoint that accepts a year and a month and returns the employee's payday and the day we have to make payment.

Create a frontend that utilises this API endpoint.

Create tests to verify the functionality of the API and Frontend.

Provide a reproducible development environment for us to run your code and tests in.

Create a readme documenting how we run your code and tests.

Hints

Feel free to use any frameworks or libraries you want, and there are no extra points for reinventing the wheel.

The description is deliberately a little vague; don't worry about guessing precisely what we mean; we want to see how you approach the problem.
